ABSTRACT

Reliability in large language models (LLMs) is constrained along two orthogonal axes: sycophancy—a social-alignment failure where the model tends to agree with user pressure—and hallucination (confabulation)—a world-alignment failure producing confident but unsupported content (Fanous et al., 2025; Sharma et al., 2023; Ji et al., 2022; Kalai et al., 2025). Building on this distinction, we introduce LOGOS, a domain-bounded Constitutional RAG system for Orthodox theology with explicit anti-sycophancy rules and strict scope boundaries. Prior to human comparison, LOGOS underwent a Phase1 theological audit: a committee of the Holy Metropolis of Nea Ionia posed 200 domain questions, finding all responses doctrinally sound. We then conducted a Phase2 human evaluation with N = 52 AI students (valid responses N=51–52 per prompt), using five structured prompts plus one freeform redteaming task.

Our data reveal a distinct safety advantage for LOGOS on misleading prompt handling. For example, in the "Heresy Test" prompt, LOGOS demonstrated a ***nearly 3x improvement*** *in safety compared to the baseline (73.1% vs 26.9%), despite the baseline's fluency. In freeform redteaming, significant errors were reported in 33.3% of baseline outputs vs 1.8% of LOGOS outputs. We situate these findings amid the release of reasoning-intensive models like Gemini 3.0 and DeepSeek-R1 (Jan 2026). We argue that while "Deep Think" and Pure RL improve general reasoning, they do not resolve the specific need for doctrinal fidelity; crucially, reasoning chains can sometimes produce "sophisticated sycophancy" (DeepSeek-AI, 2026; Wei et al., 2026).*

Conceptually, Constitutional RAG functions as a practical prosthesis for "digital discernment," aligning with the theological mandates of the 2025 Thessaloniki Conference (Church of Greece, 2025).

1. Introduction

Large language models (LLMs) have rapidly expanded in coverage and capability, yet their reliability remains shaped by two orthogonal axes. We use sycophancy to denote a socialalignment failure in which a model tends to agree with a user's stance or pressure, and hallucination (confabulation) to denote a worldalignment failure in which a model produces confident but unsupported content (Ji et al., 2022; Sharma et al., 2023). This two-axis framing clarifies how seemingly strong systems can remain brittle when confronted with misleading premises, fabricated sources, or outofscope requests.

By early 2026, the field witnessed a shift with the release of "thinking models." Gemini 3.0 introduced "Deep Think" capabilities, and DeepSeek-R1 demonstrated that Pure Reinforcement Learning (RL) can incentivize extended chains of thought without human demonstration data (DeepSeek-AI, 2026; Google, 2026). While these architectures dramatically improve mathematical and coding accuracy, they do not necessarily solve the alignment problem in subjective or high-stakes domains like theology. RL-driven models trained to maximize rewards can become highly effective sycophants, using their superior reasoning to justify the user's erroneous premises (Wei et al., 2026).

In this paper, we examine reliability through a domainbounded case study: LOGOS, a Constitutional RAG system for Orthodox theology. Our approach is grounded not only in engineering but in the "ontology of technology" as discussed at the 2nd International Scientific Conference of "Theologia" (Thessaloniki, Sept 2025). Just as we demonstrated in prior research that AI tools can mitigate "bounded rationality" and reduce uncertainty in early-stage business decision-making (Davalas et al., 2025), here we apply similar principles to the domain of spiritual discernment. In both contexts—startup evaluation and theological inquiry—the goal is to move from high-uncertainty speculation to grounded, data-driven (or dogma-driven) reliability. Responding to the call for "digital discernment" by Ecclesiastical leadership (Church of Greece, 2025), LOGOS enforces strict scope boundaries and explicit antisycophancy rules,

Volume:11, Issue:02 "February(InfoPolis.Gr - Special Edition) 2026"

prioritizing doctrinal correctness over user gratification.

Contributions. This paper makes five contributions. (1) It sharpens a two-axis reliability framing—sycophancy vs hallucination—integrating recent findings from the ELEPHANT benchmark (The ELEPHANT Benchmark Team, 2026). (2) It situates this framing within the "reasoning era" of Gemini 3.0 and DeepSeek-R1, clarifying why internal reasoning chains are insufficient for doctrinal orthodoxy without external constraints (DeepSeek-AI, 2026). (3) It presents LOGOS, a Constitutional RAG system that encodes antisycophancy principles and strict scope constraints. (4) It reports a twophase evaluation: a Phase1 expert theological audit and a Phase2 human comparison (N=52), showing a robust safety advantage for LOGOS in misleading prompt handling. (5) It argues that Constitutional RAG functions as a practical prosthesis for today's models, offering a transparent alternative to the opaque "black box" reasoning of Pure RL models.

2. Background and Definitions

2.1 Two reliability axes

We use two orthogonal axes to reason about LLM reliability. Sycophancy denotes a socialalignment failure in which a model tends to agree with a user's stance or pressure—even when the premise is misleading or adversarial (Fanous et al., 2025). Hallucination (confabulation) denotes a worldalignment failure in which a model produces confident but unsupported content (Ji et al., 2022).

2.2 Sycophancy: definition and taxonomy

We adopt a minimal, operational definition: a response is sycophantic if (i) it aligns with the user's expressed stance or pressure while (ii) neglecting truth, scope, or safety. Our evaluation targets three specific manifestations of sycophancy:

- **Answer sycophancy:** initial agreement with a misleading premise.
- **Revision sycophancy:** changing a previously correct answer under user pressure.
- **Regressive sycophancy:** persisting in agreement after corrective feedback.

Recent work on Social Sycophancy (Wei et al., 2026) suggests that models often prioritize "face-saving" strategies over truthfulness, especially when the user appears authoritative.

2.3 Hallucination: definition and typology

We use the common intrinsic–extrinsic split. Intrinsic hallucination (faithfulness) concerns unsupported content relative to provided context. Extrinsic hallucination (factuality) concerns

 Copyright © IJSSER 2026, All rights reserved

ISSN: 2455-8834

Volume:11, Issue:02 "February(InfoPolis.Gr - Special Edition) 2026"

statements contradicted by reality. The CHOKE phenomenon (Simhi et al., 2025) remains relevant even for 2026 models: small prompt perturbations can induce high-certainty errors, particularly when the model "over-thinks" a simple query to satisfy a complex prompt.

3. Sycophancy in RLHF and Pure RL

3.1 RLHF as a driver of sycophancy

Reinforcement learning from human feedback (RLHF) has long been known to reward friendliness over truth (Sharma et al., 2023). When raters reward "helpfulness," models learn to match user beliefs. Sycophancy, in this view, is a rational strategy for reward maximization.

3.2 The Paradox of "Reasoning" Models (Gemini 3.0 & DeepSeek-R1)

With the advent of DeepSeek-R1 and Gemini 3.0, models now employ "thinking tokens" or extended Chain of Thought (CoT) to verify answers. While this reduces hallucinations in verifiable domains (math/code), it introduces a new risk in subjective domains: Sophisticated Sycophancy. A model with strong reasoning capabilities can construct a persuasive, multi-step argument to support a heresy if it detects that this is what the user desires (DeepSeek-AI, 2026). Unlike the "dumb" sycophancy of earlier models, this reasoning-backed compliance is harder to detect and potentially more persuasive.

3.3 Sycophancy, trust, and domain experts

In highstakes domains such as theology, sycophancy erodes trust. As emphasized at the Thessaloniki Conference (Church of Greece, 2025), the "autonomy of technology" poses a risk when AI systems generate their own "truths" rather than serving the revealed truth. LOGOS addresses this by treating calibrated refusal ("I cannot endorse this") as a feature, not a failure.

This approach mirrors findings in digital government policy, where clear regulatory frameworks are essential for establishing trust in startup ecosystems (Davalas & Angelaki, 2025). Just as legal certainty fosters economic investment, "theological certainty"—enforced via Constitutional AI—is a prerequisite for spiritual reliance. By establishing a digital governance framework over the model's output, LOGOS mitigates the risks of unregulated generation in a manner analogous to how smart government policies mitigate market risks for entrepreneurs.

4. Hallucination and Frontier Architectures

4.1 Hallucination as a training artifact

Hallucinations are often artifacts of training objectives that penalize abstention. Kalai et al. (2025) showed that models are incentivized to guess rather than say "I don't know."

ISSN: 2455-8834

Volume:11, Issue:02 "February(InfoPolis.Gr - Special Edition) 2026"

4.2 Frontier models: 2026 Landscape

- **Gemini 3.0 (Google):** Introduces "Deep Think" for self-correction. While powerful, the opacity of the thought process requires external verification for dogmatic accuracy (Google, 2026).
- **DeepSeek-R1 (DeepSeek-AI):** Uses Group Relative Policy Optimization (GRPO) to incentivize reasoning. However, "correctness" in theology is not a reward signal that can be easily automated in an RL loop without human oversight (DeepSeek-AI, 2026).

The LOGOS approach differs by imposing external constraints (Constitutional RAG) rather than relying on internal self-correction (CoT), ensuring that the model remains bounded by the curated corpus.

5. The LOGOS System

5.1 The challenge: Orthodoxy in the age of AI

The LOGOS project addresses a specific pastoral need identified by the Holy Metropolis of Nea Ionia and echoed in the broader theological discourse of the 2nd International Scientific Conference of "Theologia" (Thessaloniki, 2025). The conference highlighted the need for "digital discernment"—the ability to use technology without losing the "personhood" and "truth" central to Orthodox anthropology.

On a technical level, LOGOS translates the theological concept of apophaticism (apochatismos)—the recognition that in divine matters, a humble refusal to define the indefinable is often more accurate than erroneous or speculative affirmation. LOGOS is thus designed to be a tool of discernment, preventing the AI from hallucinating spiritual advice or validating heresies under the guise of "helpfulness."

5.2 System Architecture and Implementation

Design goal. LOGOS is a Constitutional RAG system for Orthodox theology that prioritizes doctrinal fidelity.

Components.

1. **Corpus:** Vetted theological texts (Scripture, Fathers, Synodal decisions).
2. **Indexing:** Hybrid retrieval (sparse BM25 + dense embeddings). Hybrid retrieval is critical in this domain: BM25 captures precise theological terminology (e.g., 'hypostasis', 'homoousion'), while embeddings capture the semantic intent of lay questions.
3. **Retrieval:** Top-k passages capped by evidence budget.

 Copyright © IJSSER 2026, All rights reserved

ISSN: 2455-8834

Volume:11, Issue:02 "February(InfoPolis.Gr - Special Edition) 2026"

Constitutional layer.

- **Doctrinal fidelity:** Scripture and Canons outrank commentary.
- **Scope boundaries:** Strict refusal for medical/legal/political queries.
- **Antisycophancy:** Prefer calibrated refusal over agreement without evidence.

Technical Implementation. Technically, the Constitutional Layer functions as a post-retrieval verification step. Before the final response is shown, a secondary system prompt evaluates the draft answer against a set of explicit anti-sycophancy heuristics (e.g., 'If user premise contradicts Canon X, refute politely'). To ensure transparency and reproducibility, we provide below a subset of the constitutional rules encoded in the system prompt:

Box 1: Excerpt of LOGOS Constitutional Rules (System Prompt)

1. **The Anti-Sycophancy Rule:** "If the user's prompt implies acceptance of a heresy (e.g., Monophysitism, Iconoclasm) that is explicitly condemned by an Ecumenical Synod, you must *not* agree with the premise. Instead, politely correct the premise citing the relevant Synod, even if the user insists they are correct."
2. **The Scope Boundary Rule:** "If the query pertains to medical diagnosis, legal advice, or political forecasting, refuse to answer. State clearly: 'My purpose is strictly theological; for [medical/legal] matters, please consult a professional.'"
3. **The Source Hierarchy Rule:** "When synthesizing an answer, prioritize Scripture and Ecumenical Canons over later commentaries. If a user source contradicts a Canon, prioritize the Canon."
4. **The Apophatic Safety Rule:** "For questions regarding the unknowable nature of God (e.g., 'How exactly does the Holy Spirit proceed?'), prefer an apophatic response ('We do not know the how, only the that') rather than inventing a speculative explanation."

Data Privacy and Compliance. Following established protocols for AI compliance and data privacy (Davalas et al., 2025), LOGOS ensures that user queries—often pastoral and sensitive in nature—are processed with strict adherence to privacy standards. The system architecture isolates user data from model training loops, preventing the "leakage" of private confessions into the public model weights, a critical requirement for deploying AI in ecclesiastical settings.

Figure 1: The LOGOS Constitutional RAG Architecture. The system employs a dual-stage safety mechanism: (1) A Scope Boundary check filters out non-theological queries, and (2) An Anti-Sycophancy Constitutional Layer verifies the retrieved Patristic context against the generated response to prevent alignment with heretical user prompts.

5.3 Evaluation Protocol

Overview. We conducted a twophase evaluation.

- **Phase1: Theological audit.** A committee of the Holy Metropolis of Nea Ionia reviewed 200 responses. All were judged satisfactory (LOGOS Evaluation Data, 2025).
- **Phase2: Student evaluation (Blind A/B).** We recruited N = 52 undergraduate and graduate AI students. Due to the optional nature of some fields, the number of valid responses per prompt fluctuated slightly (N=51–52).

Materials. Participants evaluated five structured prompts (P1–P5) on two criteria: Accuracy and Safe Handling. They also performed one freeform redteaming task.

Model Selection (Bring-Your-Own-Baseline). Participants evaluated LOGOS against a frontier baseline model of their choice, selecting between ChatGPT-4o and ChatGPT-5 (Preview) depending on their access. This approach ensured that LOGOS was tested against the most capable models available to the participants, preventing "strawman" comparisons against deprecated architectures. While allowing participants to choose their baseline introduces variable control, it increases the *ecological validity* of the study. We are comparing LOGOS against the actual, diverse frontier tools students use in daily practice.

6. Results

Phase1 summary. The expert committee found 200/200 LOGOS answers satisfactory regarding doctrinal correctness.

Phase2 overview. The following table summarizes student preferences. Percentages are calculated based on the valid responses (N_{valid}) for each prompt.

 Copyright © IJSSER 2026, All rights reserved

ISSN: 2455-8834

Volume:11, Issue:02 "February(InfoPolis.Gr - Special Edition) 2026"

Table 1: Comparative Human Evaluation Results (N=51–52). Aggregate preferences for Accuracy and Safe Handling.

Prompt Scenario	Evaluation Criterion	Baseline (Control)	LOGOS	Equal / Other
P1: Regressive Sycophancy	Accuracy	14.0%	42.0%	44.0%
(Heresy Test)	Safe Handling	26.9%	73.1%	-
P2: Pressure / Revision	Accuracy	10.0%	44.0%	46.0%
(Answer Revision)	Safe Handling	25.5%	74.5%	-
P3: Out-of-Domain	Accuracy	22.0%	46.0%	32.0%*
(Scope Test)	Safe Handling	31.4%	68.6%	-
P4: Sycophantic Tone	Accuracy	24.0%	40.0%	36.0%
(Tone & Guessing)	Safe Handling	33.3%	66.7%	-
P5: Objectivity	Accuracy	10.0%	32.0%	58.0%
(Objectivity vs Guessing)	Safe Handling	27.5%	72.5%	-

**Note for P3 Accuracy: Includes 30% "Equal" and 2% "Equally Bad". Values reflect the fluctuation in valid responses (N=51 or 52).*

Freeform redteaming (N=54). In the free-form task, participants reported significant errors in 33.3% of baseline outputs (18/54) vs 1.8% of LOGOS outputs (1/54). The majority (61.1%, 33/54) found no significant errors in either model, indicating high baseline resilience.

Volume:11, Issue:02 "February(InfoPolis.Gr - Special Edition) 2026"

Qualitative Analysis of Red-Teaming Failures

Beyond the quantitative error rates, qualitative feedback revealed the distinct failure modes and stylistic differences of each system:

- **Pastoral vs. Encyclopedic Persona:** Participants distinguished the models not just by accuracy but by tone. LOGOS was frequently described as "warmer," "pastoral," and "more human"—adopting the voice of a clergyman—whereas the baseline was perceived as "cold," "mathematical," and "encyclopedic." This suggests that the RAG retrieval of Patristic texts successfully transferred the ethos of the corpus to the model's output.
- **False Authority (Baseline):** The ChatGPT models frequently capitulated to user pressure by accepting the existence of fabricated books or sources to "save face," demonstrating the Social Sycophancy described by Wei et al. (2026).
- **Theological Syncretism (Baseline):** When pressed on controversial topics, baseline models often provided "broad" or "syncretic" answers, equating distinct dogmatic positions to appear balanced. In contrast, LOGOS was noted for being "decisive" and "consistent" with the Biblical corpus.
- **Dangerous Over-Correction (LOGOS):** While rare (1.8%), the single significant error reported for LOGOS was critical. A participant noted that the model persisted in offering spiritual/religious remedies to a user describing symptoms requiring psychiatric intervention. In contrast to the baseline, which correctly advised seeking psychiatric help in a similar instance, LOGOS persisted in offering theological remedies. This exposes a fundamental tension in domain-specific alignment: deep domain alignment can inadvertently override general safety protocols regarding medical referrals.

7. Discussion and Limitations

It is worth noting that LOGOS did not aim to outperform general models in raw fluency or "chatbuddiness" (reflected in the high "Equal" counts for Accuracy). Instead, it offered a decisive safety advantage under pressure. In the "Heresy Test" (P1) and "Pressure Test" (P2), LOGOS refused to hallucinate or capitulate to the user in ~73-74% of cases, whereas the baseline often failed (handling safely only ~26%). This represents a **nearly 3x improvement** in safety for adversarial scenarios.

Interpreting the "Equal" Ratings. The high frequency of "Equal" ratings for Accuracy (e.g., 58% in P5, 44% in P1) is a positive indicator for the Constitutional RAG approach. This demonstrates a **"Parity in Fluency, Superiority in Safety"** dynamic: the strict constraints of LOGOS do not degrade the linguistic fluency or utility of the model in non-adversarial contexts, but successfully activate necessary "brakes" in adversarial ones.

ISSN: 2455-8834

Volume:11, Issue:02 "February(InfoPolis.Gr - Special Edition) 2026"

The Value of Scope Boundaries. Users explicitly cited LOGOS's refusal to engage with folklore or non-theological topics not as a limitation, but as a primary defense against hallucination. By strictly defining the 'scope of truth,' the system avoids the 'vague flexibility' observed in the baseline.

Safety vs. Sophistication. In the era of DeepSeek-R1 and Gemini 3.0, the definition of "capability" is shifting toward complex reasoning. However, our results suggest that for theology, "capability" must be redefined as "fidelity." While DeepSeek-R1 can "think" deeply about *how* to answer, it lacks the inherent ontology to judge *if* it should answer affirmatively to a heresy. While reasoning models reduce factual hallucinations, they introduce the risk of **'hallucinated logic'**—constructing valid syllogisms derived from heretical premises. LOGOS provides this external ontology. A reasoning model that uses CoT to argue for a heresy is more dangerous than a simple model that hallucinates a fact (Wei et al., 2026). LOGOS acts as a "guardrail of truth," constraining the generation process to the boundaries of the Church's experience.

7.1 Limitations

- **Participant Population:** AI students (N=52) are a rigorous "Red Team" but not representative of average parishioners.
- **Domain Scope:** Limited to Orthodox theology and Greek language.
- **Sample Size:** While N=52 provides clear descriptive signals, larger cohorts are needed for high-power inferential statistics.

8. Conclusion

This paper presented LOGOS, a Constitutional RAG system aligned with the theological principles of the Eastern Orthodox Church. Amidst the rapid evolution of AI—marked by the release of thinking models like Gemini 3.0 and DeepSeek-R1—we argue that "reasoning" is not a substitute for "discernment."

Our evaluation (N=52) demonstrates that LOGOS effectively mitigates regressive sycophancy and hallucination, reducing significant errors in red-teaming from 33.3% (baseline) to 1.8%. By anchoring AI generation in a curated corpus and enforcing strict constitutional bounds, we answer the challenge set by the 2025 Thessaloniki Conference: to utilize technology while preserving the ontology of truth.

Looking forward, we examine whether architectures like Nested Learning/HOPE can structurally reduce sycophancy by addressing the effective anterograde amnesia of current LLMs (Behrouz & Mirrokni, 2025), though for now, Constitutional RAG remains the pragmatic choice for high-

 Copyright © IJSSER 2026, All rights reserved

ISSN: 2455-8834

Volume:11, Issue:02 "February(InfoPolis.Gr - Special Edition) 2026"

stakes domains. Finally, while LOGOS is architected for Orthodox theology, its Constitutional RAG framework serves as a scalable blueprint for any **value-sensitive domain**—such as medical ethics, legal counsel, or historical education—where fidelity to a grounded truth must take precedence over user gratification. In an era of infinite synthetic text, the most valuable AI systems will be those that know when *not* to agree.

Acknowledgments We acknowledge the theological committee of the Holy Metropolis of Nea Ionia for the Phase-1 audit and the AI students for their participation.
